

A screw magazine includes a form-stiff framework (1) having a front side (4) and a back side (5) between which a plurality of mutually spaced-apart bores (10) extend, each one of which is delimited by an endless limiting wall (11) of a resilient, demolishable nature and of which at least some house screws (12) located at a distance from each other. The length of the individual screw (12) is smaller than the depth of the framework (1) counted as the distance between the front and back sides (4, 5), a free tip of the individual screw being located at a certain distance inside the back side of the framework, at the same time as an end surface on the head of the individual screw (12) is situated in flush with the front side (4) of the framework.
